Preventing of Storage Stain in Coils Storage and Handling of Formed Panels Storage at The Job Site Summary Storage stains are white or black corrosion products formed while the hot dip galvanized or Galvalume® Coated Sheet Steel is in a coil form or in a tight stack. Long term exposure to water or moisture in an oxygen deprived environment can cause storage stain. The most common sources of storage stain are when the steel is in a coil or a bundle of panels. Storage stains are white or black corrosion products formed while the hot dip galvanized or Galvalume® Coated Sheet Steel is in a coil form or in a tight stack. Long term exposure to water or moisture in an oxygen deprived environment can cause storage stain. The most common sources of storage stain are when the steel is in a coil or a bundle of panels. Any time a portion of the steel is exposed to moisture and deprived of oxygen, storage stain can occur. Storage stain should be prevented because it is very difficult to remove without affecting the appearance and/or the performance of the products.
